

Updating XP to the v5.2.0.2 Wallet

Official website: <https://www.experiencepoints.io>

Telegram: <https://t.me/XPcoinOfficial>

Discord: <https://discord.gg/cRdmwdz>

Explorer: <https://chainz.cryptoid.info/xp>

Step 1: Back up your XP wallet

Before you do ANYTHING else, make sure you have a safe backup of your XP wallet. You should be doing this regularly, anyway!

- Find your XP data folder. Unless you've changed it, your wallet file is in:

Windows: %APPDATA%/eXperiencePoints

Linux: ~/.eXperiencePoints/

Mac: \$HOME/Library/Application Support/eXperiencePoints/

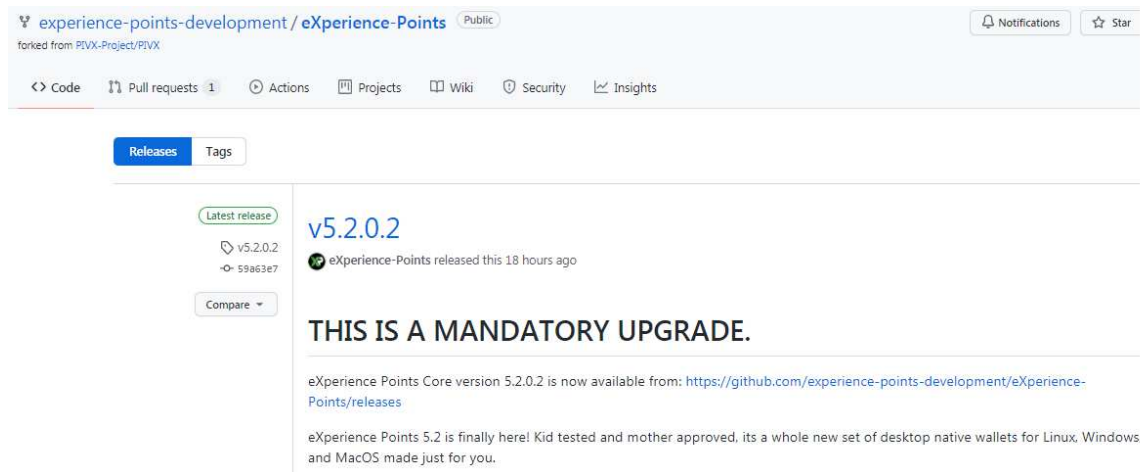

- Copy the wallet.dat file to somewhere safe.
-

- You may also wish to take backup copies of your eXperiencePoints.conf and masternode.conf files, especially if you've made changes to them.
-

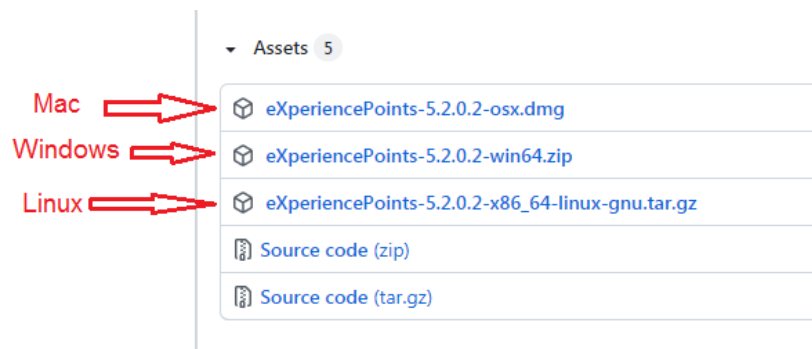

Step 2: Download the new wallet

The new wallet is version 5.2.0.2 and is available from GitHub. There's a separate build for each OS.

- Go to XP's GitHub: <https://github.com/experience-points-development/eXperience-Points/releases>

- Scroll down to the release packages and choose the one for your OS:

- Wait for the download to complete.

Step 3: Install the wallet

- Extract or install the new wallet in the usual way. If you don't know how to do this, visit the FAQ or ask for help on Discord/Telegram.
-

- Move the two "sapling" files to your data folder (see Step 1 if you forgot where that is).

Name	Size	Packed	Type
..			File folder
eXperiencePoints-cli.exe	5,501,440	2,195,934	Applicati
eXperiencePointsd.exe	14,461,440	5,872,909	Applicati
eXperiencePoints-Qt.exe	43,795,472	21,880,546	Applicati
eXperiencePoints-tx.exe	6,644,736	2,739,922	Applicati
sapling-output.params	3,592,860	3,427,013	PARAMS
sapling-spend.params	47,958,396	47,719,681	PARAMS

- Run the wallet.

It will upgrade the chain and database, then synch as normal.

Step 4: No Connections?

If the wallet won't connect and synch, delete the peers.dat file from your data folder (see Step 1 if you forgot where that is) and restart the wallet.

Deleting the peers.dat file forces the wallet to pick up XP seed nodes for the new version.

Step 5: For -datadir users

If you use the -datadir switch to use a different data folder, your wallet will complain about the “sapling” files even though you moved them.

- Add the -paramsdir switch to your command line, pointing it to your data folder.
-

- For example, if you’re on Windows with the executable and all your data (including the “sapling” files) in D:\XP...

Your old command line was:

```
D:\XP\eXperiencePoints-Qt.exe -datadir="D:\XP"
```

Your new command line is:

```
D:\XP\eXperiencePoints-Qt.exe -datadir="D:\XP" -paramsdir="D:\XP"
```
